

## Hetzner Object Storage Backups: Step-by-Step Guide

Hetzner Object Storage provides S3-compatible backups at €0.023/GB/mo (50GB free tier), perfect for Coolify volumes/DB snapshots. This setup automates daily backups of FastAPI/Supabase/Redis/PostHog data to a €3/mo Storage Box with 7-day retention. <sup>[1]</sup> <sup>[2]</sup>

### Step 1: Create Hetzner Project & Bucket

1. Hetzner Console > Cloud > Create Project ("coolify-backups").
2. Object Storage tab > "Create Bucket":
  - Name: coolify-backups-2026
  - Location: Falkenstein (fsn1) or Nuremberg (nbg1)
  - Versioning: Enable (protects against deletes)
3. Note endpoint: `https://fsn1.your-objectstorage.com/coolify-backups-2026` <sup>[1]</sup>

### Step 2: Generate S3 Credentials

1. Project > Security > "S3 Credentials" > "Create API Token"
  - Name: "coolify-backup"
  - Permissions: Object Read/Write
2. Copy Access Key (e.g., HCZ...) and Secret Key (securely store).
3. Test: `curl https://fsn1.your-objectstorage.com` (should return XML). <sup>[2]</sup>

### Step 3: Configure Coolify S3 Backup

Coolify UI > Settings > Backups:

1. "Add S3 Provider":

```
Provider: Custom S3
Endpoint: https://fsn1.your-objectstorage.com
Access Key: HCZ...
Secret Key: your-secret-key
Bucket: coolify-backups-2026
Region: fsn1
```

2. Test Connection > Save.
3. Applications tab > Your App (FastAPI/Supabase) > Backups:
  - Schedule: Daily 02:00 UTC

- Retention: 7 days
- Include: /data volumes, DB dumps

4. Enable for all services (Next.js static, Postgres data).<sup>[3]</sup>

## Step 4: Install Restic (Advanced Manual Control)

SSH VPS for Docker volume backups:

```
apt install restic -y
```

Create wrapper script /root/backup-hetzner.sh:

```
#!/bin/bash
export RESTIC_PASSWORD="your-secure-password"
export RESTIC_REPOSITORY="s3:https://fsn1.your-objectstorage.com/coolify-backups-2026"
export AWS_ACCESS_KEY_ID="HCZ..."
export AWS_SECRET_ACCESS_KEY="your-secret-key"
export AWS_DEFAULT_REGION="fsn1"

# Backup Coolify volumes
restic -o s3.bucket-lookup=dns backup /var/lib/docker/volumes \
  --exclude=/var/lib/docker/volumes/coolify*_builds

# Prune old snapshots
restic forget --keep-daily 7 --keep-weekly 4 --prune
```

```
chmod +x /root/backup-hetzner.sh
/root/backup-hetzner.sh # Test
```

## Step 5: Automate with Cron

```
crontab -e
```

Add:

```
0 2 * * * /root/backup-hetzner.sh >> /var/log/hetzner-backup.log 2>&1
0 3 * * * restic check # Integrity
```

Verify: `tail -f /var/log/hetzner-backup.log`<sup>[2]</sup> <sup>[1]</sup>

## Step 6: Coolify App-Level Backup

For each service (Supabase, Redis):

1. App > Backups > "Create Manual"
2. Select volumes: ./postgres-data, ./redis-data

3. Destination: Hetzner S3 bucket

4. Download/restore via UI

## Step 7: Restore Process

Coolify UI: App > Backups > Select snapshot > Restore.

Manual Restic:

```
export RESTIC_REPOSITORY=... # Same as backup
restic snapshots
restic restore latest --target /restore/path --include /var/lib/docker/volumes/your-app
```

## Monitoring & Costs

- Alerts: Coolify notifies backup failures via Telegram.
- Size: restic stats shows encrypted size.
- Cost: 100GB = €2.30/mo + traffic (€0.01/GB out).
- Test: Delete test file, restore verification.

| Backup Type  | Frequency | Size Est.    | Restore Time |
|--------------|-----------|--------------|--------------|
| Coolify UI   | Daily     | 5-20GB       | 5min click   |
| Restic Cron  | Daily     | 10GB deduped | 15min manual |
| DB Snapshots | Hourly    | 1GB          | Instant      |

This gives 3-2-1 backup (3 copies, 2 media, 1 offsite) for €5/mo total.<sup>[1]</sup>
